Test Box Recovery Tool

Version 5.0

June 6, 2010

The text-box recovery tool allows DrRacket or DrScheme v370 and later to read programs created using v360 and earlier that include test-case boxes.

When opened using this tool, test-case boxes are turned into `check-expect` forms.

Test boxes plain-text tests and expected results are converted to plain-text `check-expect` forms.

If either the test or expected-result expression contains non-text (e.g., an image), the converted form is a comment box containing a `check-expect` form. The box should be easy to remove using the Racket|Uncomment menu item in DrRacket.
